

# Provisioned – MSK(kafka Cluster With Producer & Consumer

## 1 . Create an Amazon MSK cluster :-

- my task is to insert and consume some data through msk(kafka).
- Create MSK cluster by logging into aws console (<https://aws.amazon.com/console/>)
- select custom create and give cluster name as "**my-msk-cluster**"
- select cluster type as **provisioned** and Apache Kafka version **2.8.1**
- select **kafka.t3.small** broker type , brokers per zone is "**1**" ,total number of zones "**3**".
- Amazon EBS Storage per broker = **100 gb**
- then give **next** in the bottom of page .
- select default **vpc** and **AZ's** and **subnets**.
- then created sec-grp (msk-kafka-sg)

```
1 22-----0.0.0.0/0 or <vpn ip> or <my ip>.  
2 80-----0.0.0.0/0(internet).
```

- then check **Unauthenticated access & Plaintext** then **next**.
- then directly create the **cluster**.

## 2 . Create client machine and assign IAM role :-

- then created EC2 **msk-ec2** selecting **t2-micro** with Amazon linux 2 AMI giving the default settings. with associating **IAM role**.
- install **Java** on the ec2 by running the following command:

```
1 sudo yum install java-11 -y
```

- Run the following command to download **Apache Kafka**.

```
1  wget https://archive.apache.org/dist/kafka/2.8.1/kafka_2.12-2.8.1.tgz
```

1. Run the following command in the directory where you downloaded the **TAR file** in the previous step to get **kafka\_2.12-2.8.1 file**.

```
1  tar -xzf kafka_2.12-2.8.1.tgz
```

- Go to the `kafka_2.12-2.8.1/libs` directory, then run the following command to download the Amazon MSK IAM JAR file. The Amazon MSK IAM JAR makes it possible for the client machine to access the cluster.

```
1  wget https://github.com/aws/aws-msk-iam-auth/releases/download/v1.1.1/aws-msk-iam-auth-1.1.1-all.jar
```

- Go to the `kafka_2.12-2.8.1/bin` directory. Copy the following property settings and paste them into a new file. Name the file `client.properties` and save it.

```
1  security.protocol=SASL_SSL
2  sasl.mechanism=AWS_MSK_IAM
3  sasl.jaas.config=software.amazon.msk.auth.iam.IAMLoginModule
   required;
4  sasl.client.callback.handler.class=software.amazon.msk.auth.iam.
   IAMClientCallbackHandler
```

- wait until the cluster changes into **Active** status.
- (**aws kafka list-clusters --region <your region>** ) with this command check the list of clusters in particular region. (aws kafka list-clusters --region ap-southeast-1)
- will get this as output:-

```
ec2-user@ip-10-0-216-92 ~]$ aws kafka list-clusters --region ap-southeast-1

            }
          },
          "SecurityGroups": [
            "sg-05208bdf4629539d1"
          ]
        }
      }
    }
  ]
}
```

clusters is (ap-southeast-1)

### 3 . Create a Topic :-

- 1 ( /home/ec2-user/kafka\_2.12-2.8.1/bin/kafka-topics.sh --create -  
-bootstrap-server <<bootstrap server address>> --replication-  
factor 3 --partitions 1 --topic <Our topic name> )

### 4 . List Topics using

- 1 ( /home/ec2-user/kafka\_2.12-2.8.1/bin/kafka-topics.sh --  
bootstrap-server <<bootstrap server address>> --list )

- by using the previous command i got these topics **\_\_amazon\_msk\_canary**  
**\_\_consumer\_offsets**  
**mskcluster**

### 5 . Produce Topic :-

- 1 ( /home/ec2-user/kafka\_2.12-2.8.1/bin/kafka-console-producer.sh  
--bootstrap-server <<bootstrap server address>> --topic <Our  
topic name> )

## 6 . Consume topic :-

```
1 ( /home/ec2-user/kafka_2.12-2..8.1/bin/kafka-console-consumer.sh
  --bootstrap-server <<bootstrap server address> --topic <Our
  topic name> --from-beginning )
```

- duplicate the same ec2 and login into that then make one ec2 as **producer** and another as **consumer** , among both for one ec2 use **produce** command and in duplicate ec2 use consumer command .
- then try to enter data into into producer , we can see the same data in consumer too updating then and there .
- if the consumer getting the data from producer the task is sucessfull.
- hence the task got completed sucessfully.....!
